

$4 + 5 * 6 + 7 / 8$

For this, it would output a number and not conduct any true or false statements.

$4 + 5 * 6 < 7 / 8$

This would create a false statement because the left side is a larger number than the right.

$4 + 5 > 6 \ \&\& \ 7 < 8$

This would create a true statement because both are true statements and it has the "&&."

$1 \ \&\& \ 0$

This would either be a true or false statement depending on the situation if a variable is set to 1 or 0.
